

caBIG™, caTissue, and Achieving Silver-Level Compatibility

Ian Fore D.Phil.

*Associate Director, Biorepository and
Pathology Informatics
NCI Center for Biomedical Informatics
and Information Technology*

November 5, 2007

- Informatics in the Best Practices
 - Functions
 - Development
 - Security
- caBIG
 - Why caBIG compatibility?
 - What does it take?
 - Support programs
- caBIG and Tissue Banks
 - caTissue Core
 - caTIES
 - caTissue Suite

Informatics and the Best Practices

- Aim to identify the major areas that biorepository software should support
 - Participant registration
 - Consent tracking
 - Biospecimen collection
 - Processing
 - Storage
 - Distribution
 - Specimen QA & QC
 - Security
 - Who can see/access/order which specimens
 - Reporting
 - Help biorepository managers to manage their collection...
 - What's past its "use by" date

- Treat each physically distinct entity as a different specimen
 - ... with its own identifier
- Maintain parent-child relationship of specimens
 - Aliquoting
 - Molecular extracts
- Linkage to physical labelling
 - Barcodes

- Seek to integrate with those clinical data systems that provide useful clinical annotation of stored biospecimens
 - Pathology systems
 - Anatomic pathology
 - Clinical pathology
 - Cancer registries
 - Operating room systems
 - Anesthesia records

- To match the special nature of human biospecimens systems should be protected by adequate security
 - Physical access to systems
 - Back up of systems containing often irreplaceable resources
 - Login protections
 - Role based security that only allows access to authorized information
- National Institute of Standards and Technology (NIST)
- *Risk Management Guide for Information Technology Systems*
 - Use to help determine level of risk for a particular system
 - Set security mechanisms to match the risk

- Health Insurance Portability and Accountability Act (HIPAA)
- Human Subjects Research - CFR Title 45 Part 46
- FDA requirements - CFR Title 21 Part 11
- NIH Principles and Guidelines for Sharing of Biomedical Resources
- NIH Data Sharing Policy

- **Use of structured information**
 - **Databases instead of free text**
- **Build vs Buy**
 - Understand the true costs
 - Plan for the future
 - Establishing a resource that will realize its value in years
 - Make sure the informatics will still be around then
 - Open source
- **If you're going to build...**
 - End user involvement
 - Use cases
 - Follow a system development methodology
 - E.g. Unified Process
 - Strive for CMMI Level 3

caBIG[™] cancer Biomedical
Informatics Grid[™]

caBIG[™] – NCI's Approach to the IT Infrastructure

**NATIONAL
CANCER
INSTITUTE**

Integrative Cancer Research

Provides tools and systems to enable integration and sharing of information.

Tissue Banks & Pathology Tools

Provides for the integration, development, and implementation of tissue and pathology tools.

In vivo Imaging

Provides for the sharing and analysis of *in vivo* imaging data.

Responsible for evaluating, developing, and integrating systems for vocabulary and ontology content, standards, and software systems for content delivery.

Vocabularies & Common Data Elements

Developing architectural standards and architecture necessary for other workspaces.

Architecture

Training

training in the use of the caBIG[™] resources including on-line tutorials, workshops, training programs.

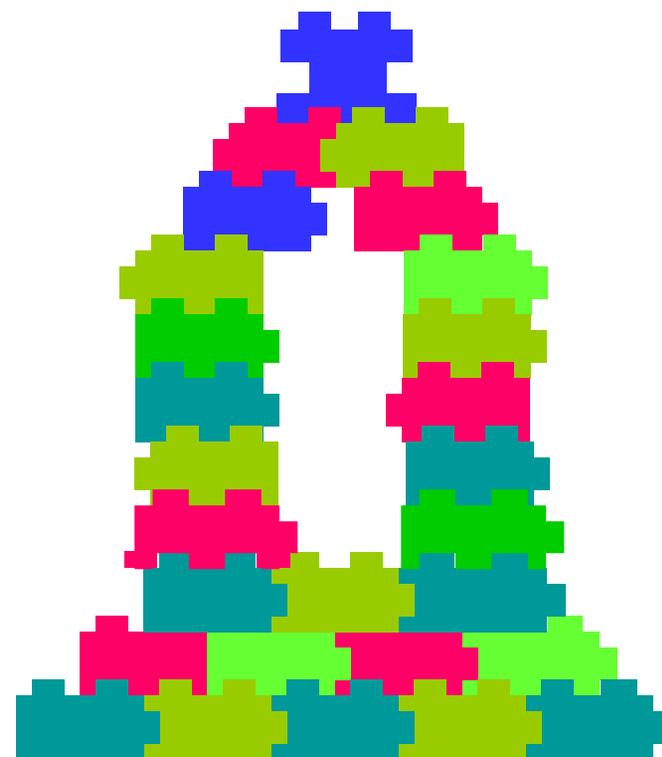

Strategic Planning

Assists in identifying strategic priorities for the development and evolution of the caBIG[™] effort.

- Integrated Systems
 - Homegrown/Commercial
 - Smooth navigation between applications
 - Difficult to expand/extend
 - Large IT staff
 - \$10M's invested
- Heterogeneous Systems
 - Complex mix of commercial and homegrown components (may be composed of dozens of components)
 - No common interfaces
 - Medium size IT staff
 - \$1M's invested
- Informal/ no systems
 - Use of productivity applications (e.g. Excel, Access)
 - Complex manual processes
 - Small or no IT staff
 - \$100K's invested

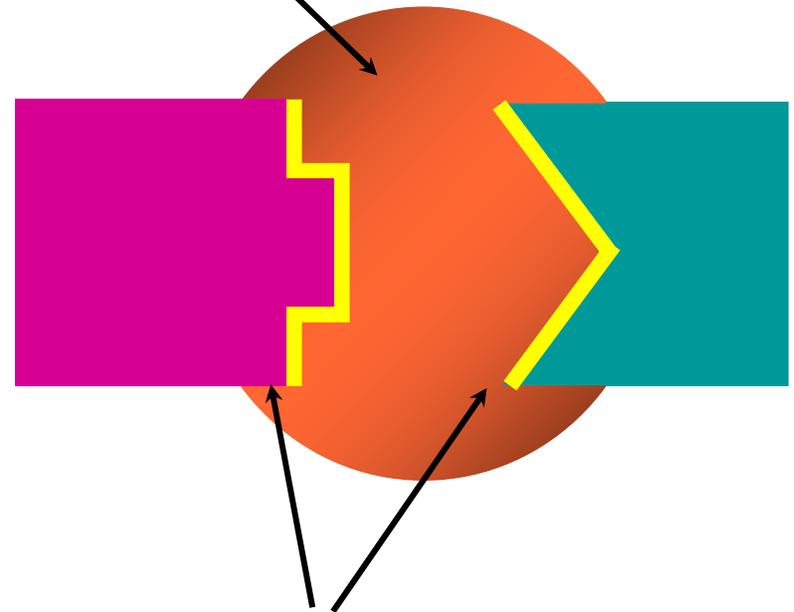

- **Modules that address specific needs**
- **Connect through defined Electronic interfaces**
- **Use of international data standards**

- **focus on boundaries of how how things fit together, not on the internal details**
- **once they're built: assume that will be diverse & changing**

The glue that binds parts together is middleware infrastructure

Shape of boundary is defined in APIs

- Virtual biorepositories
 - The ability to search networked biospecimen databases
- Support for multi site studies
 - Specimens collected at multiple locations
 - E.g. Prostate SPORE Biomarker study
- Rare diseases
 - Statistical power only reached through pooling resources
- Biospecimens are the raw material for molecular analysis platforms
 - Need to exchange data with their informatics systems
- Linkage to clinical data on biospecimens
 - Key data on specimens and patients exists in other systems
- Development of common practices for biospecimen handling
 - Establishing common data elements will support this

Biospecimen Best Practices Toolkit: Written Background Materials

- Items for distribution at meetings and through the OBBR Web site
 - ✓ NCI Best Practices for Biospecimen Resources
 - ✓ Biospecimen Basics: An Overview of the NCI Best Practices for Biospecimen Resources
 - ✓ **Implementing caBIG™ for Biospecimen Resources: An Overview**
 - ✓ **Implementing caBIG™ for Biospecimen Resources: Next Steps**
 - ✓ Providing Your Tissue for Research
 - ✓ Other biospecimen-related articles, publications, and news stories of interest

Implementing caBIG™ for Biospecimen Resources: An Overview

- One-page document with broad overview of caBIG™ for Biospecimen Resources
- Target audiences include:
 - ✓ Patients and Patient Advocates
 - ✓ NCI-designated Cancer Center Directors
 - ✓ Strategic Thinkers at Institutes and Biospecimen Resources
- Topics Covered:
 - ✓ What is caBIG™ and What does it offer Biospecimen Resources?
 - ✓ Strategic Considerations
 - ✓ Benefits to patients and advocates
 - ✓ Benefits to researchers and resource directors

Implementing caBIG™ for Biospecimen Resources: Next Steps

- **9-page document highlighting “The Road to caBIG™ Compatibility”**
- **Designed for resources interested in the specific steps required for implementing caBIG™ compatibility**
- **Addresses public comments and frequently asked questions**
- **Setting the Stage:**
 - ✓ Core Concepts
 - ✓ How does caBIG™ compatibility work
 - ✓ FAQs
- **Turning to Solutions:**
 - ✓ Available software tools
 - ✓ Overview of Alternatives
 - ✓ Skills, Technology, and Resources Required

Options for Biospecimen Resources

Option	Operating Scenario	Recommended Solution
1	Your resource has a paper-based system or a homegrown tool that would not be painful to abandon.	Adopt caTissue Core, and migrate existing electronic data to new tool.
2	Your resource has an existing basic tool that you want to keep. Examples: Access or mySQL database.	Become caBIG[™] compatible by installing caTissue Core, and then mapping your tool to it. Connect from your tool to the outside world through caTissue Core.
3	Your resource has an existing informatics tool - more complex than a simple database, with separate modules for reporting and storage (e.g., standard reports are a small extract from a larger database system).	Make the existing tool caBIG[™] compatible for your standard reports only. Data generated in required reports would be caBIG[™] compatible; the underlying data need not be.
4	Your resource has an existing complex informatics tool (like Option 3), but your reporting needs vary greatly, and you would like to have the entire system caBIG[™] compatible for maximum flexibility.	Make the full database compatible, by creating an interface that maps the existing tool's data structures to caBIG[™] standards. This is the highest investment solution.

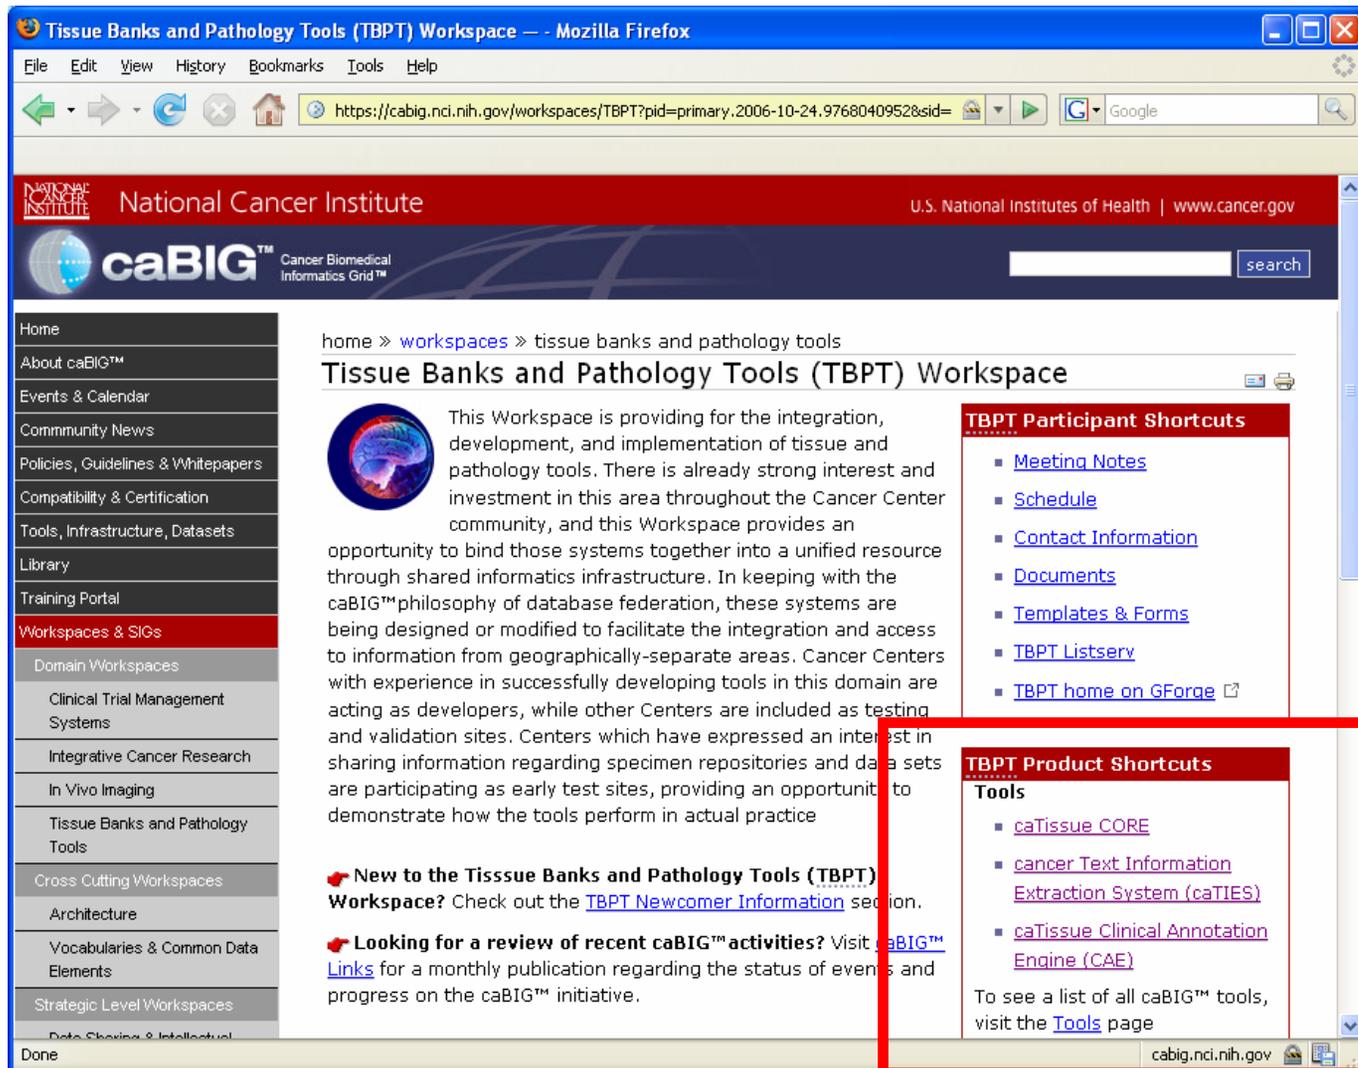

caBIG Biorepository and Pathology Tools

caBIG™ Benefits Biospecimen Resource Leaders, Researchers and Advocates

- **Leveraging existing software tools available through caBIG™ reduces software development costs for biospecimen resources**
- **The shared standards governing caBIG™ allows even small repositories to advertise their presence and specimen/data availability – AND – learn what others have to offer**
- **Your own research comes first – you can select the data to share**
- **caBIG™ tools already have built-in security and privacy considerations – enhancing patient confidence**
- **Increased data sharing increases the effectiveness and efficiency of cancer research – helping individual scientists, the cancer research community, and ultimately the cancer patient**

The willingness of cancer patients to share tissue is fundamental to cancer research. Our willingness to share biospecimen-related data is critical to maintaining public trust.

Tissue Banks and Pathology Tools (TBPT) Workspace

 This Workspace is providing for the integration, development, and implementation of tissue and pathology tools. There is already strong interest and investment in this area throughout the Cancer Center community, and this Workspace provides an opportunity to bind those systems together into a unified resource through shared informatics infrastructure. In keeping with the caBIG™ philosophy of database federation, these systems are being designed or modified to facilitate the integration and access to information from geographically-separate areas. Cancer Centers with experience in successfully developing tools in this domain are acting as developers, while other Centers are included as testing and validation sites. Centers which have expressed an interest in sharing information regarding specimen repositories and data sets are participating as early test sites, providing an opportunity to demonstrate how the tools perform in actual practice

 **New to the Tissue Banks and Pathology Tools (TBPT) Workspace?** Check out the [TBPT Newcomer Information](#) section.

 **Looking for a review of recent caBIG™ activities?** Visit [caBIG™ Links](#) for a monthly publication regarding the status of events and progress on the caBIG™ initiative.

cancer Text Information Extraction System (caTIES)

The screenshot shows the caTIES web interface. On the left is a navigation menu. The main content area displays a search query with a flowchart and a list of patient records. The flowchart shows a hierarchy: 'Sex' (M) leads to 'Age' (40-49 years), which then branches into 'Search Terms' (genetic information) and 'Search Terms' (histological description of prostate gland). The 'Search Terms' (genetic information) further branches into 'Search Terms' (High Grade Prostate International Prostate Index Grade 10/10 Gleason Score) and 'Search Terms' (Prostate Biopsy Interpretation). The patient list on the right includes columns for Patient ID, Order Type, and Available Tools.

What's Required: Skills and Technology Needed

- Some specialized IT skills are required to adopt caBIG[™] tools, and to make an existing tool caBIG[™] compatible.
 - ✓ Required skills: Intermediate Java and/or .NET development skills, with experience installing dependent software sets (e.g., Java, JBOSS, MySQL), administering systems, configuring line code, and similar tasks of moderate technical complexity.
 - ✓ Options 1, 2 or 3 described above will take a few weeks – or less.
 - ✓ Full system conversion (Option 4) is likely to take more investment – on the order of months rather than weeks.
 - ✓ We don't have precise cost estimates for recommended options at this time.

You do not have to hire full-time staff, or invest in an IT lab, to fulfill bioinformatics best practices.

You may need to “borrow” personnel at your institution with specialized IT skills for initial installation and routine maintenance.

The technical environment will include application and database servers; likely to be available at your institution without heavy investment by your lab if you don't already have them.

How can information technology help fight cancer?

The National Cancer Institute is launching a 21st century information initiative that will transform the way we do cancer research. We are creating a network that will freely connect the entire cancer community. In doing so, we are leveraging valuable resources and saving precious time toward new discoveries. [Read More](#)
